## Belarus

In Belarus, data on deaths are available from 1981 to 2014 in the WHO mortality database.

Of the four major causes of death considered, Cardiovascular Disease (CVD) is the most important, followed by all malignant neoplasms and Chronic Obstructive Pulmonary Disease (COPD). Mortality rates from cancer, cardiovascular disease and COPD are higher in men than in women. An increase in mortality from all forms of cancer, cardiovascular disease and COPD has been observed since the 1980s, followed by a decline starting in the mid-1990s for all cancer and the early 2000s for cardiovascular disease and COPD. Mortality from diabetes remains difficult to interpret.

Lung and breast cancers are the commonest causes of cancer death. For colorectal and breast cancers, the mortality trends are similar to all cancer mortality: an increase between 1981 and 2000, followed by a subsequent decrease. For lung cancer, the same trend is observed in men, however in women, lung cancer mortality seems stable over the period studied. On the other hand, remarkable declines in mortality from stomach cancer are observed in both genders throughout the period studied. Finally, mortality from haematological malignancies seems quite stable.

This report was prepared by Peter Boyle, Miruna Dragomir, and Cécile Pizot of the International Prevention Research Institute in Lyon, France.
