Country Reports

-

Kazakhstan

In Kazakhstan, data on deaths are available from 1981 to 2015 in the WHO mortality database.

Of the four major causes of death considered, Cardiovascular Disease (CVD) is the most important, followed by all malignant neoplasms and Chronic Obstructive Pulmonary Disease (COPD). Mortality rates from all forms of cancer, cardiovascular disease and COPD are higher in men than in women. An increase in mortality from all malignant neoplasms was observed since 1981 followed by a decline starting in the early 1990s. For cardiovascular disease, mortality rates increased until the mid-2000s and then decline until 2015. Regarding COPD, abrupt changes occurred over the period: an increase from 1981 to the mid-1990s, followed by a decrease until 2010 and then an increase occurred again until 2015.

Lung and breast cancers are the commonest causes of cancer death. Mortality trends from lung cancer, colorectal cancer and breast cancer increased from 1981 to the early 1990s, the mid-1990s and 2000, respectively, and then declined until 2015. Regarding stomach cancer, mortality rates are decreasing since 1981. Insufficient data exist to examine trends in haematological malignancies.

This report was prepared by Peter Boyle, Miruna Dragomir, and Cécile Pizot of the International Prevention Research Institute in Lyon, France.
