## Republic of Moldova

In the Republic of Moldova, data on deaths are available from 1981 to 2015 in the WHO mortality database.

Of the four major causes of death considered, Cardiovascular Disease (CVD) is the most important, followed by all malignant neoplasms and Chronic Obstructive Pulmonary Disease (COPD). Mortality rates from all forms of cancer, cardiovascular disease and COPD are higher in men than in women. An increase in mortality from all forms of cancer has been observed since 1981. Abrupt changes were observed for cardiovascular disease mortality: a declining trend was observed from 1981 to the early 1990s followed by an increase until the mid-2000s and then the rates declined again until 2015. Regarding COPD, an increasing trend in mortality was observed until the early 2000s followed by a decline until 2015. Mortality from diabetes remains difficult to interpret.

Lung and breast cancers are the commonest causes of cancer death. Mortality rates from colorectal cancer and breast cancer increased over the period 1981-2015 while stomach cancer and haematological malignancies rates declined over the same period. Regarding lung cancer, mortality rates in men increased until the late 1980s followed by a decline until the late 2000s and then the rates began to increase again while in women the rates were slightly on the rise over 1981-2015.

This report was prepared by Peter Boyle, Miruna Dragomir, and Cécile Pizot of the International Prevention Research Institute in Lyon, France.
