## Slovakia

In Slovakia, data on deaths are available from 1992 to 2014 in the WHO mortality database.

Of the four major causes of death considered, Cardiovascular Disease (CVD) is the most important, followed by all malignant neoplasms and Chronic Obstructive Pulmonary Disease (COPD). Mortality rates from all forms of cancer, cardiovascular disease and COPD are higher in men than in women. An increase in mortality from cancer has been observed from 1992 to the late 1990s, followed by a decline until 2010 and then the rates stabilised in men and increased in women. For cardiovascular disease, a decrease in mortality has been observed since the early 1990s. Regarding COPD, a stable mortality trend is observed since the late 1990s. Mortality from diabetes remains hard to interpret.

Lung and breast cancers are the commonest causes of cancer death. For haematological malignancies, colorectal cancer and breast cancer, the mortality trends are similar to all cancer mortality with increasing rates from 1992 to the late 1990s followed by declines until 2010 and then the rates increased again. Regarding lung cancer, an important decline in mortality was observed in men since 1992 while in women mortality rates are on the rise. Mortality from stomach cancer is decreasing since 1992 in both men and women.

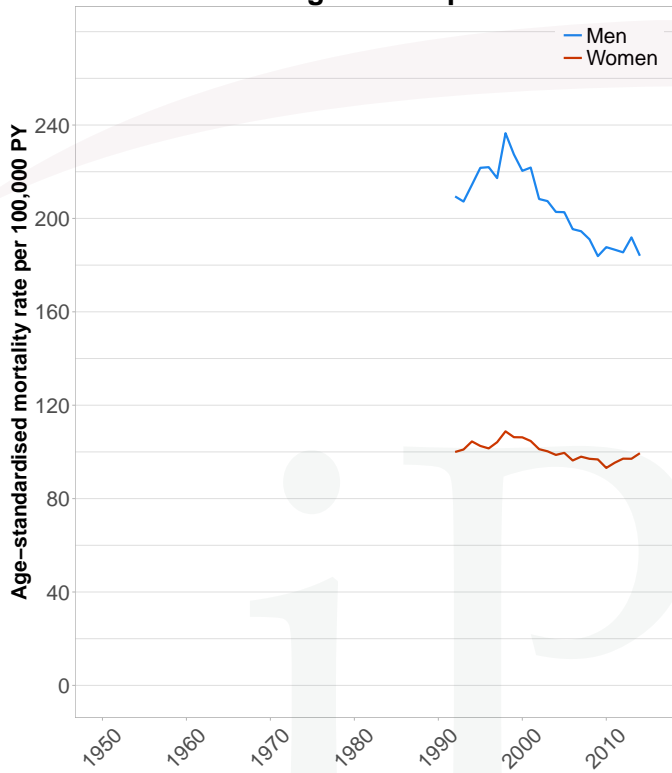

This report was prepared by Peter Boyle, Miruna Dragomir, and Cécile Pizot of the International Prevention Research Institute in Lyon, France.
