## Tajikistan

In Tajikistan, data on deaths are available from 1981 to 2005 in the WHO mortality database.

Of the four major causes of death considered, Cardiovascular Disease (CVD) is the most important, followed by all malignant neoplasms and Chronic Obstructive Pulmonary Disease (COPD). Mortality rates from cancer, cardiovascular disease and COPD are higher in men than in women. Mortality rates from cardiovascular disease and COPD are increasing from 1981 to 2005. Regarding all malignant neoplasms, mortality rates increased until the late 1980s, then decreased until the mid-1990s when the rates began to increase again. Mortality from diabetes remains difficult to interpret.

Stomach and breast cancers are the commonest causes of cancer death. For haematological malignancies, colorectal cancer, stomach cancer and lung cancer, mortality trends are similar to all cancer mortality with increasing rates until the late 1980s followed by a decline until the mid-1990s and then the rates level off or increase again. Regarding breast cancer, mortality rates appeared stable over the period 1981-2005.

This report was prepared by Peter Boyle, Miruna Dragomir, and Cécile Pizot of the International Prevention Research Institute in Lyon, France.
