Country Reports

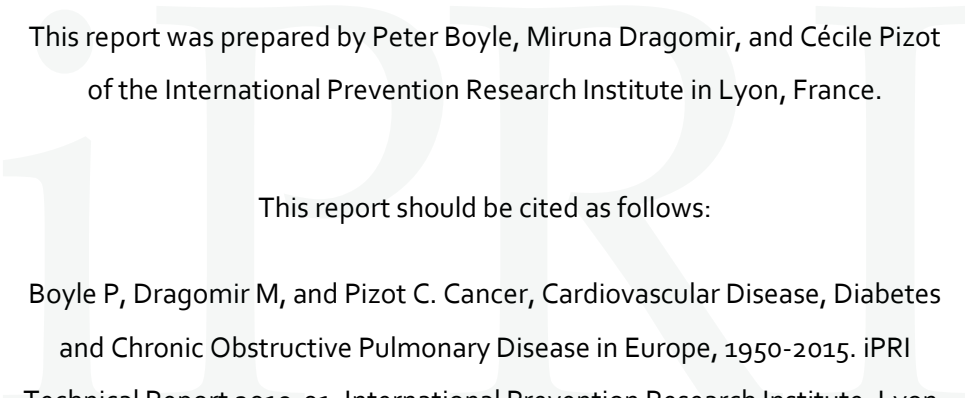

-

Ukraine

In Ukraine, data on deaths are available from 1981 to 2015 in the WHO mortality database.

Of the four major causes of death considered, Cardiovascular Disease (CVD) is the most important, followed by all malignant neoplasms and Chronic Obstructive Pulmonary Disease (COPD). Mortality rates from all forms of cancer, cardiovascular disease and COPD are higher in men than in women. An increase in mortality from cancer, COPD and cardiovascular disease has been observed from 1980 to the early 1990s, the mid-1990s and the mid-2000s, respectively, followed by a decline until 2015. Mortality from diabetes remains difficult to interpret.

Lung and breast cancers are the commonest causes of cancer death. Mortality rates from lung cancer and haematological malignancies are increasing from 1981 to the early 1990s and the mid-1990s, respectively followed by a decline until 2015. Regarding colorectal cancer, mortality rates increased from 1981 to the mid-1990s and then the rates levelled off. The same trend was observed for breast cancer but in the late 2000s the rates begins to decrease. Finally, a decline in mortality from stomach cancer was observed in both genders since 1981.

This report was prepared by Peter Boyle, Miruna Dragomir, and Cécile Pizot of the International Prevention Research Institute in Lyon, France.
